

Coding exercise

Create a web page based on the mockup at the end of this document. The basic requirements:

- Create a database for the account balances
- Connect to the database via an AJAX call to populate the balances
(It's okay to include a JSON file with the data set but this should be a separate request/file)

In addition to the output, we'd like to see this in a git repository

BONUS:

Include account names & IDs in the database and call those to display on the page, as well.
